engineering pipes, plate, ductile and brittle materials, and composites. CAESAR II is an add-on to the CAESAR software platform that enables the same user interface and analysis of an FE model as that of the CAESAR base software. CAESAR II is the most widely used pipe analysis software in the world. CAESAR II uses the FEAST (Finite Element Analysis Simulation Technique) process to produce the most accurate analysis results. CAESAR II has already been implemented for piping projects in numerous countries and industries, including chemical plants, nuclear power plants, offshore rigs, oil refineries, and other industries. CAESAR was developed by F-Otus GmbH and first released in 1990. The software has been continually improved over the years with new and improved features and functionality, and has been translated to a variety of languages. CAESAR II was created in collaboration with industry experts and engineers, including the company that developed the CAESAR software platform, F-Otus GmbH. The development and support of CAESAR II takes place with the support of the company's parent company, F-Otus GmbH. Learn more at www.foetus.com/caesar2/. FEAST (Finite Element Analysis Simulation Technique) ----- FEAST is the underlying technology that allows CAESAR II to analyze all types of engineering objects. FEAST, initially developed by F-Otus GmbH and Dr. Hans-Jürgen Weidmann, DVM, PhD, is an advanced finite element (FE) software technology that enables the use of multiple-channel data acquisition systems and the most accurate possible analysis results. FEAST is a licensed technology. FEAST, which stands for Finite Element Analysis Simulation Technique, uses a split-step method to analyze engineering objects. The object of analysis is divided into a certain number of meshes and sections. The meshes and sections are further divided in sub-meshes. The software then calculates the result based on the material properties of the mesh and section. After the mesh and section are created, a mesh resolution is specified. The goal is to ensure that the number of points or elements is sufficient to avoid the occurrence of numerical instability and to achieve a good simulation result. CAESAR II 82157476af
